

Digitus 600W Wiegand Unit

Most access control systems use a standard communication language (protocol) called Wiegand.

The 26-bit Wiegand protocol allows for 65,536 users.

Each user of your existing system will already be assigned a unique ID between 0 and 65,535.

The Digitus 600W is designed to seamlessly integrate with existing access control systems using the **26 bit Wiegand protocol**.

The Digitus 600W is supplied in a reader-only configuration as all the door relays, sensors, etc are contained within the existing controller.

Integrating a Digitus 600W with your existing system is as easy as removing your existing reader (swipe card or proximity) and replacing it with the 610W.

The Digitus 600W is then programmed with the Wiegand parameters of your existing system via the keypad and LCD. ***SIMPLE!***

The Digitus 600W allows you to store this unique number for each user and will output this number to the existing controller after successfully verifying the users fingerprint.
